# Introduction to Dify

**Introduction to Dify**
1. Course Content
2. Dify
    2.1 Introduction
    2.2 Functions

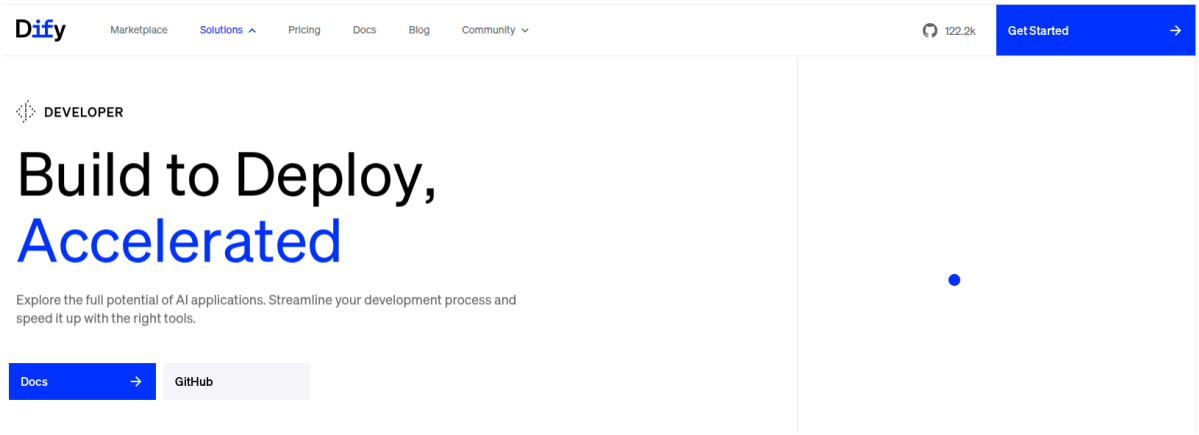

## 1. Course Content

- Understand the basic functions of Dify to facilitate the subsequent development of AI agents.

## 2. Dify

### 2.1 Introduction

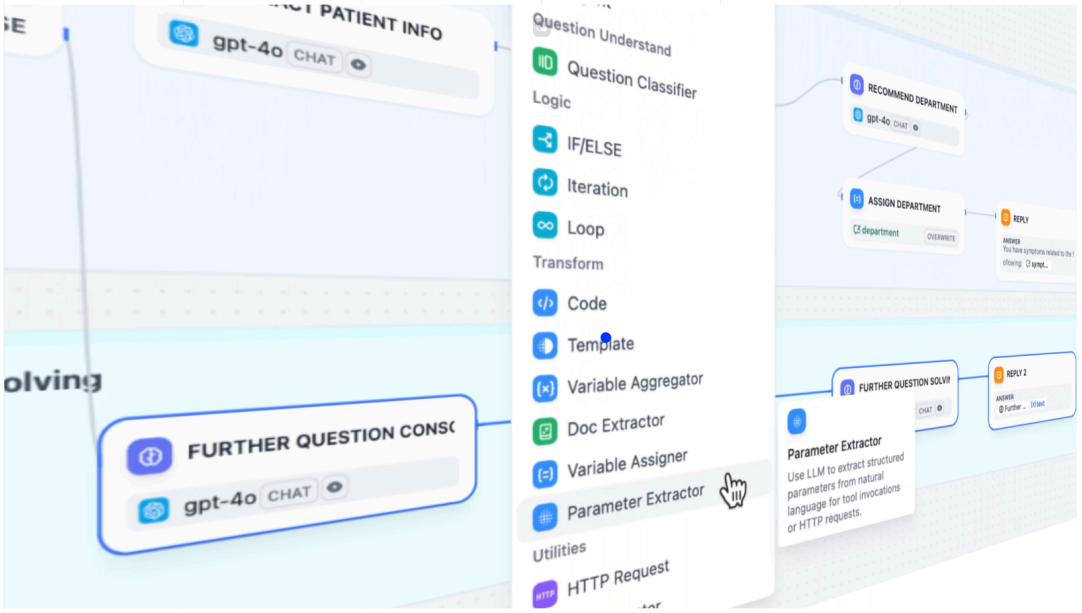

- Dify is an open-source development and deployment platform for a **production-grade Agentic AI solution**, enabling developers to quickly build, deploy, and scale AI applications without complex technical barriers.

### 2.2 Functions

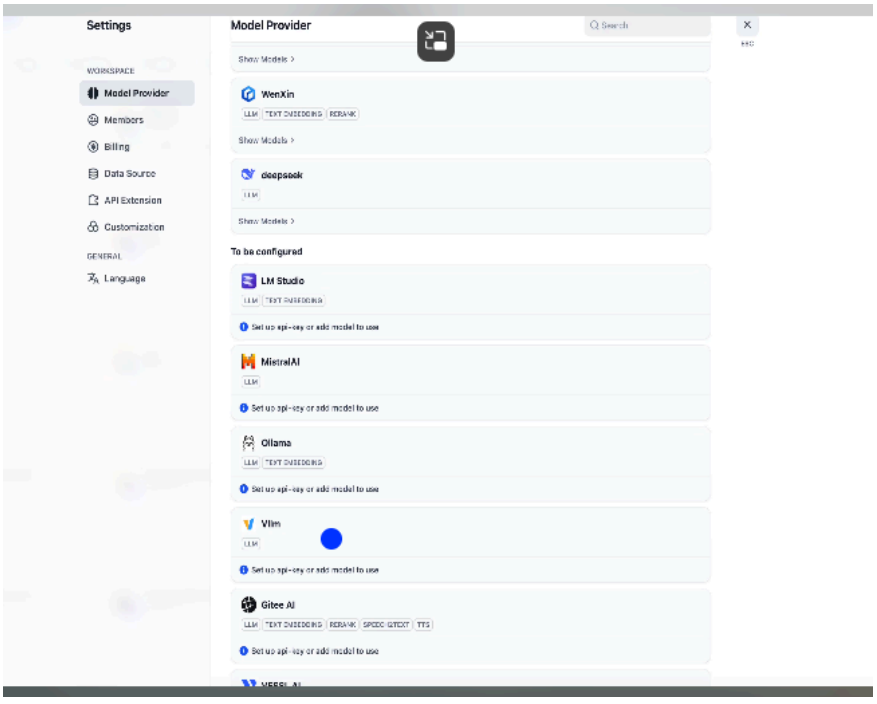

- Visually build AI applications

Intuitively design AI workflows and applications through **drag-and-drop operations**, supporting the combination and nesting of complex logic, without the need for in-depth backend development. Quickly complete the construction from idea to underlying logic, and rapidly build powerful AI agent applications.

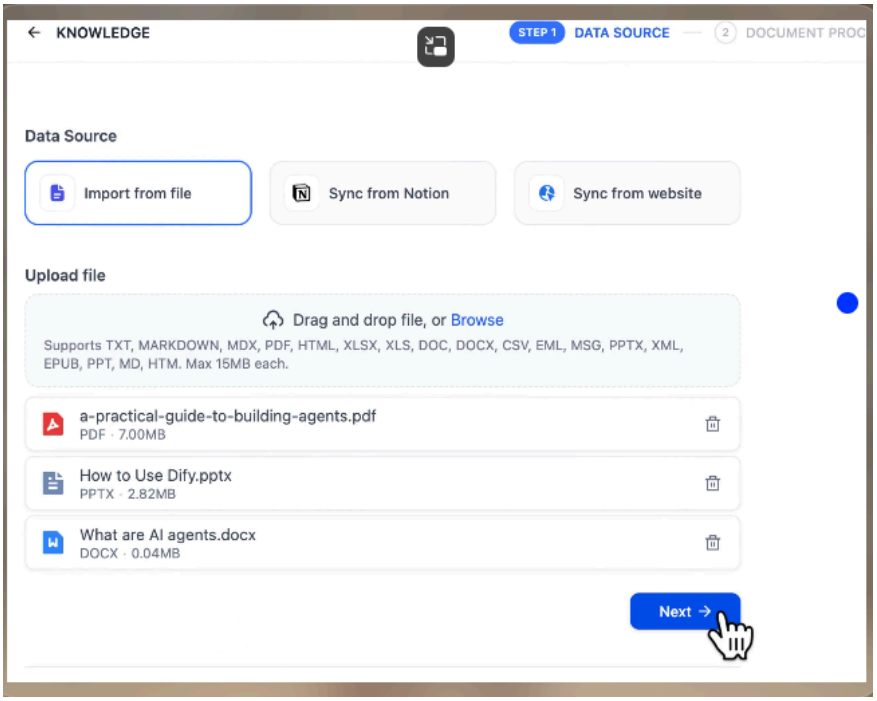

- Seamlessly integrate AI large models from model providers worldwide

Simply apply for the API-KEY of the corresponding model provider, and you can integrate hundreds of online model services with one click.

- Multi-source data support

  Dify can extract and transform data from diverse data sources, automatically build indexes and store them in a vector database, providing efficient RAG (retrieval-augmented generation) for large models, and can directly deploy a local RAG knowledge base.

- A rich plugin system

Through Dify's rich plugins, AI large models can be combined with tools and RAG knowledge bases to become AI agents, providing a boost for AI applications in different vertical domains.
